Cotton Varieties Planted, United States  
1973-1977

Stoneville and Deltapine were the leading varieties of cotton planted in the United States in the 1977-78 season, according to the Cotton Division, Agricultural Marketing Service, USDA. Stoneville accounted for almost one-fourth of this year's acreage and Deltapine made up almost one-fifth. Lankart was the third leading variety, being planted on about one-eighth of the acreage. The other major varieties, Acala, Coker and Paymaster, combined, accounted for about one-fourth of the acres planted this year.

Stoneville was the leading variety of cotton planted in the United States for the third consecutive year and made up 23 percent of the 1977 cotton acreage. This was the same percentage as a year earlier. Stoneville was the leading variety planted in Alabama, Tennessee, Missouri and Arkansas and was the second leading variety in Mississippi, Louisiana and Arizona. Stoneville 213, the principal Stoneville strain, represented 21 percent of total cotton acreage.

Deltapine was the second leading variety planted. Acreage planted to Deltapine in 1977 was estimated at 18 percent, down from 20 percent a year earlier. Deltapine was the most popular variety in Florida, Mississippi, Louisiana and Arizona and was the second leading variety in Alabama, Tennessee, Missouri, Arkansas and California. Deltapine 16 was the predominant Deltapine strain and comprised 10 percent of the total cotton acreage planted in the United States.

Lankart was the third leading variety this year at 12 percent of the total acreage. This was the same as a year earlier. Lankart was the leading variety in both Texas and Oklahoma.

Acala, the fourth leading variety, comprised 10 percent of total planted acreage this season, the same as a year earlier. Acala was the principal variety planted in New Mexico and California.

Paymaster was the fifth leading variety planted this year, accounting for nine percent of total acreage. This compares with eight percent a year earlier. Paymaster was the second most popular variety in Texas.

The sixth leading variety planted was Coker. This variety represented four percent of acreage this season, down from six percent a year earlier. Coker was the leading choice of growers in North Carolina, South Carolina and Georgia and was the second leading variety in Florida.

Pima S-5 was the leading strain of American Pima cotton planted in 1977, accounting for 94 percent of the total Pima acreage against 80 percent a year earlier. In 1975, Pima S-4 was the leading strain. Pima S-4 was the second leading strain this year at four percent of planted acreage.

Estimates of the percentages of the various varieties of cotton planted in the United States in 1977, by counties, Smith-Doxey cotton classing office territories and states are presented in this report. Comparative variety data for the four years 1973-76 are shown by states. The variety data are based primarily on estimates furnished by cotton ginners for the territories served by their gins.

\*\*\*\*\*

Estimated percentage of cotton acreage planted to specified varieties, United States, 1973-1977

Year	Acala	Coker	Deltapine	Lankart	Paymaster	Stoneville	Other	Total

1/ Compiled from "Summary of Cotton Fiber and Spinning Test Results, Crop of 1976", USDA, AMS, Cotton Division, June 1977.

2/ Micronaire reading is a measure of fiber fineness and maturity. This test measures resistance of a plug of cotton to air flow.

3/ Fiber strength indicates ability of cotton fibers to withstand force or tension, and has a strong bearing on spinning utility. Zero gage fiber strength test made without a spacer between clamp jaws using Pressley flat bundle tester. 1/8" gage strength test made with 1/8" spacer between clamp jaws using Stelometer and results are adjusted to the Pressley level.

4/ Digital Fibrograph 2.5% span length indicates length spanned by 2.5 percent of the fibers when they are parallel and randomly distributed. This measure is closely related to staple length designations. Digital Fibrograph 50/2.5 uniformity ratio values indicate relative uniformity of fiber length in samples.
